

MORPH — Architecture Overview

Channel slices (injection & diagonal-decay targets within each stream's $C=768$):

Compute (384)

Context (256)

Memory (128)

Note: x_0 /value-embeds inject into the context slice; bigram is full-width; the core's diagonal injection (spectral radius < 1) decays the context slice. The residual mechanism is HC (above), not the channel slices.
